

UE19CS353 – Object Oriented Analysis and Design with Java

Theory ISA (Mini Project)

Presentation on
EXAM REGISTRATION SYSTEM

By:

Manali Tanna – PES2UG19CS214

Milinda K N – PES2UG19CS233

Mohammed Uzair Rizwan – PES2UG19CS238

6th Semester D

PES University, Bengaluru

(Established under Karnataka Act 16 of 2013)

Department of Computer Science & Engineering

Session: Jan - May 2022

Project Description

- Exam Registration System is a web based application where students can register for an exam on a date and pay for exams.
- The project has a login and a sign up page for all the students/users
- The user can also register and view the exams. Also CRUD operations.
- The payment portal is also available for debit and credit card

Object Oriented Analysis and Design with Java (Mini Project)

Tools and Frameworks Used

- MYSQL 8(MySQL workbench)
- SPRING TOOL SUITE

Object Oriented Analysis and Design with Java (Mini Project)

Design Principle and Design Patterns Applied

- **Coupling** - low coupling has been maintained as the modules which interact with each other are not so dependent on the other.
- **Cohesion** - high cohesion is maintained by keeping all related code in a single place for example code related to calculation of scores along with displaying results is written in the results file.
- **Single class responsibility** – each class should have a single responsibility for example answers class is only used to display the answers to all the questions at once, connect class has the sole purpose of connecting to the database etc.

Object Oriented Analysis and Design with Java (Mini Project)

Design Principle and Design Patterns Applied

- **Open close** – software entities must be open for extension and closed for modification example the behaviour of the classes we have used can be extended without modifying code via inheritance/composition.
- **Singleton** - The pattern creates only one object of the class. It has a private constructor with public access for the instance.
- **MVC Architectural Pattern** was used to organize the business logic and connect it to the entity model/database.
